

Superstore Data Cleaning Report

This project cleans a small Superstore sales dataset so it can be used reliably for analysis. The raw file contained 18 records. After cleaning, 16 records remain.

Data quality issues and resolution

Issue	Resolution
Duplicate records	Removed two exact duplicate rows for Order IDs CA-2024-1003 and CA-2024-1008.
Mixed date formats	Converted all order and ship dates to consistent, sortable date values.
Text inconsistencies	Trimmed spaces and standardized capitalization in region and category fields.
Missing values	Filled Texas region as Central and a Boston postal code as 02108 from matching data in the same state.
Incorrect data types	Converted currency, percentage, and quantity text entries into numeric values.
Negative profit	Retained negative profit values because they represent valid sales outcomes.

Files delivered

The workbook includes a Summary, Cleaned Data, Raw Data, and Change Log tab. A CSV copy of the cleaned data is included for easy use in Python, Power BI, or other tools.

Final result

The cleaned dataset is analysis-ready: it has standardized text and dates, numeric measures stored as numbers, duplicates removed, and no blank fields among the tracked columns.
